

MultiSafe

The TELETUBE **MultiSafe** system is a pneumatic conveyor system that is mainly used for cash evacuation.

It is a multi-station, one-way system that can send from multiple departure stations (with preload) to the free standing arrival unit, or straight into the safe or the cash transportation bag.

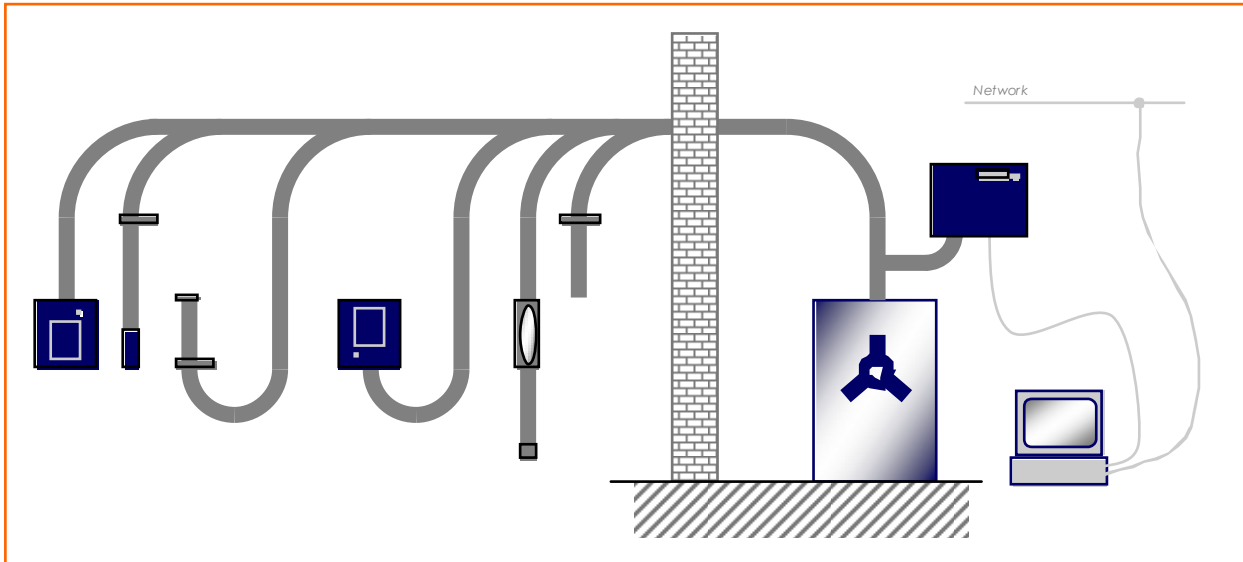

The **MultiSafe** system can use different stations types, allowing the use of small sized capsules, regular carriers or single use seal bags.

Traffic is managed by a PC or by a compact central gear, with built-in blower, key-switch, LCD display and RS232 port for configuration and monitoring purposes.

The PC-based version can handle multiple systems and has extended real-time traffic monitoring (synoptic), statistical functions and remote maintenance possibilities.

A wide range of options are available for the **MultiSafe** systems, including the possibility for remote control and monitoring over an Intranet / Internet connection.

MultiSafe

- Simple and efficient, compact
- Easy to install and integrate
- Powered by a regular 230V/16A outlet
- Full automatic
- Available in different tube sizes
- Central gear with indicators, LCD display and key-switch
- Upward or downward departure stations
- Stations with (locked) preload
- Preloads are possible at any moment
- Arrival can be free standing, or into the safe or transportation bag
- Capsules and carriers in different colors, including transparent
- Single use seal bags
- Automatic purge
- Built-in statistics
- PC monitoring, statistics and maintenance
- Remote control over intranet / internet
